I'm trying to rank startups by funding_total_usd, but some results have NULL values that are messing up my list. How would I fi lter out rows with NULL values in my SQL query so only companies with actual funding amounts appear in my results?

No search query generated

Use `IS NOT NULL` in the `WHERE` clause:

sql CollapseCopy

```sql
SELECT *
FROM startups
WHERE funding_total_usd IS NOT NULL
ORDER BY funding_total_usd DESC;
```

This excludes rows where `funding_total_usd` is `NULL` and ranks companies from highest to lowest funding.

Do not use:

sql CollapseCopy

```sql
WHERE funding_total_usd != NULL
```

SQL requires `IS NOT NULL` for testing `NULL` values.
